

ADVENTURE WORKS DASHBOARD

KEY TAKEAWAYS:

- Adventure Works have made \$24.91M gross, \$14.46M in production cost, and \$10.46M in revenue.
- Majority of the units sold are accessories having 34K units sold.
- Road bikes cost more which results to the top total price being sold.
- United States is the main consumer of Adventure Works as they produce the majority products sold.

SUMMARY:

- Gross Revenue:** \$24.91 million
- Production Cost:** \$14.46 million
- Net Revenue:** \$10.46 million
- Top Selling Products:** Accessories, with 34,000 units sold
- High-Value Products:** Road bikes, due to higher costs
- Primary Market:** The United States, accounting for most sales

CONCLUSIONS:

Adventure Works has achieved a notable financial performance, generating \$10.46 million in net revenue. The company's product mix shows a strong demand for accessories, with road bikes contributing significantly to revenue due to their higher price point. The United States stands out as the key market, driving many sales. This suggests a successful market presence and product appeal in this region, highlighting the importance of continued focus and potential growth strategies in the U.S. market.

SUSTAINABLE DEVELOPMENT GOALS (SDG2)

KEY TAKEAWAYS:

- 169 countries have underweight and wasting children while 156 countries have stunting children.
- On average, 15.07% are underweight, 6.70% have wasting, and 28.14% have stunted children under 5 years of age.
- Stunting remains a concern in 2020 with a 33.8% average prevalence worldwide.
- Malnutrition is rampant during the 1980s then decreased as time passed.
- The prevalence of malnutrition among children under 5 years of age is slowly declining; however, it is still a major concern in third-world countries located in Africa and Asia.
- Africa contains the most underweight, wasting, and stunting children under 5 years of age.

SUMMARY:

Malnutrition among children is still a major concern as it can affect physical, and cognitive development. Proper maternal nutrition, food security, and access to healthcare are essential to fixing a child's overall health. There should be nutrition, health, and simple agricultural programs to promote proper nutrition, healthcare, and food security.

CONCLUSIONS:

Despite progress in combating malnutrition, it remains a critical global issue, particularly affecting children under five. While there has been a decline in underweight, wasting, and stunting rates since the 1980s, these conditions continue to pose significant challenges, especially in Africa and Asia. The prevalence of stunting, underweight, and wasting indicates inadequate access to healthcare, nutrition interventions, and supporting environments. A multifaceted approach could improve overall health and environmental outcomes which could be beneficial to children. Effective nutrition, health, and agricultural programs are crucial in ensuring the healthy growth and development of children, ultimately fostering more equitable and prosperous societies.
